

Video File Description

1. The first video is about a single insertion of 100000 records. If you see the time, I performed the operation at 13.22 timestamp. I actually paused the recording and when it got inserted, I resumed the recording at 13.27 and that's why I pointed to the time in the video.
2. The second video is to show the deletion of data after single insertion.
3. The third video is to demonstrate the bulk loading of 100000k records.
4. The fourth video is to show the deletion of data after bulk loading.
5. The fifth video is to show the results of *Select * from Players* query operation after doing a bulk loading of 100 records. You will see the output of the results in a table in the user interface.
6. The sixth video shows any errors in the query we are entering in the textbox and you will see an error message received from the mysql and get displayed(for 10 seconds) above the select operation field.
7. The seventh video shows the error message if we try to violate the constraints while we try to insert the data into the database. We tried to insert the data with the value **AB** for the column *Position* in *Players* table. But since the column *Position* can accept only three values (QR, WR, QB), we will get an error message which is shown in the video.
8. Eighth video shows the error message when we try to insert a *varchar* value for the *PlayerID* column. The *PlayerID* column is a primary key column and accepts only integer values.
9. The ninth video shows the error message when we try to insert a second record with same primary key(1) as the first record.
